Team ID	
Project Name	OptiCrop
Maximum Marks	4 Marks

Guided Crop Recommendation User Matrix:

Journey Stage	1. Setup & Discovery	2. Metric Collection	3. Analysis Loop	4. Output Execution
User Actions	Farmer accesses OptiCrop digital frontend on web/mobile layout.	Enters local soil elements (N,P,K,pH) and environment values.	Triggers prediction classification via the Random Forest interface.	Reviews high-yield crop recommendation & compatibility scores.
User Thinking	Is this platform fast, clean, and easily usable on mobile browsers?	Are these parameter inputs straightforward to read from standard field diagnostics?	How accurate and reliable are the underlying prediction weights?	What explicit fertilization and crop shifts should I execute now?
User Feelings	Curious, hopeful, cautious.	Focused, methodical.	Anticipating, engaged.	Relieved, confident, satisfied.
Pain Points	Cluttered interfaces block fast remote onboarding.	Manual transcription risk across multiple parameter input zones.	Processing lag or lack of clear data confirmation response.	Vague recommendation readouts missing action-oriented logic metrics.
Opportunities	Keep interface minimalist with clean numeric input sliders.	Embed automated weather pre-population bounds to save entry time.	Utilize pre-cached model files for immediate runtime delivery.	Provide structured compatibility ratings split clear into suitability bands.
